~Introduction~

To understand the need for treatment and education of a disability or various dysfunctions, it is first necessary to understand the backing of many of the causes that lead to these disabilities and dysfunctions. We do this so that we then can approach these challenges with an enlightened mind come up with effective non-embrasive and at times simple ways of treatment and enhancement of individuals abilities and lives. What would you say if I told you that there was a way to enhance the overall development in children with disabilities? Those children who could not speak being able to speak, those who could not hear being able to hear sounds for the first time. Those with autism and hyperactivity being able to concentrate, and learn better. Those children with developmental delay or cerebral palsy being able to lessen their disability and enhance there mental and physical well-being. A way to lessen the effects of arthritis, a way to enhance vision, and a way to clearly breath without taking all kinds of medication. There is such a means that dramatically changes/enhances the lives of children/ individuals with varying forms of dysfunction. This paper gives light to this effect, and this author hopes that you will find this information useful.

The Human body is the most intricate and complex system of operation. It holds the key to life and death as well as many of the mysteries that we seek. Our minds and our nervous system are the key role players in the developmental process, of the body, that determines the way in which we interact and perceive the world around us.

To understand a method that improves the lives of individuals, adults/children, it is first important to shed some light on the reasons why there is a need for improvement. Here in we will take-a-look at the human skull and talk briefly about the skeletal plates. We will devote some time to the function and understanding of the spine and nervous system.

We will touch briefly, on how the brain, ears, eyes, sinuses, and teeth are all inner-related to the brains development and to the nervous system, in relation to mobility and limb movement. We

will touch basis on the background and development of a therapeutic procedure, which enhances the nervous system and decreases dysfunctions. We will spend some time in discussing the need for this therapeutic treatment, along with listing many of the symptoms that may be improved. We will touch briefly on birth trauma and other related brain injuries. We will talk about the in-depth process of Endonasal Balloon Therapy and the benefits and risks that are associated with it. We will take-a-look at David's Personal Testimony, Case Study, and reflect on a Mother's account. We will then analyze the pros and cons of the use of Endonasal Balloons, followed by a few general proposed questions and this author's responses to them. We will end with a closing statement that will hopefully create awareness and a need and thirst for knowledge.
